Dell s2340m driver update

What "drivers" for monitors usually are is an .inf file to tell the computer what resolutions and refresh rates the monitor supports - not really a driver. There may be other utilities on there to tweak color, screen position, stuff like that. Spice (4) flagReport Was this post helpful? thumb\_up thumb\_down Try it and see \$\infty\$ I guess there will be features to adjust resolution colours like gamma corrections, etc. Spice (1) flagReport Was this post helpful? thumb up thumb down It comes into play with very large monitors where you can virtually split the display into smaller screens, or for color calibration. Other than that plug and play driver works fine. Spice (2) flagReport Was this post helpful? thumb\_up thumb\_down Windows systems will locate basic driver versions for most monitors using the Windows update servers. Occasionally updates will be released as you see with other hardware. Other than that plug and play driver works fine. I can confirm this too. I recently (as per a post on here) bought 2 x 1440p monitors, the come with drivers - the drivers allow splitting the screen (something Windows 10 can also do) but with more granularity, it also comes with a nice feature of being able to change the resolution and orientation based on the resolution and orientation based on the resolution and orientation based on the resolution from within the software - while this seems trivial, it would have been a blessing with my older monitors as the input button stopped working. Mine also come with additional software, things like Eye care, that using an infrared sensor monitors how long and often you use the screens, then either disabled them or warns you to take a break, it also has built in light sensors to adjust the brightness/contrast - many features you wouldn't usually expect. One feature I really like is the save settings - you can 'save' settings to a file, such as brightness, contrast, warmth et all per input, per monitor and have them sync between displays, something that took me time with my previous setup, as each monitor had to be adjusted separately, and HDMI/DVI have slightly different colours to match. Drivers for the display itself are usually downloaded in the background, but the toys for the monitor are usually downloaded in the background, but the toys for the monitor are usually downloaded in the background, but the toys for the monitor are usually downloaded in the background, but the toys for the monitor are usually on the media - many people don't install them Spice (2) flagReport Was this post helpful? thumb\_up thumb\_down The drivers may work for other vid or photo editing software for calibration (WYSIWYG) or audio drivers (when you use the screen HDMI, USB or Displayport). I don't even remember the last time that I used monitor that I've ever used. I suppose if I was a rabid gamer and wanted the absolutely best possible connection between the graphics card and monitor, I might use them. But since I'm not a gamer, the issue has never come up. My sons are gamers (not rabid,) and they've never used (or needed) monitor drivers, either (but technically that's not relevant because I set up their computers.) 0 of 1 found this helpful thumb up thumb down Mainly for Color gamut, color calibration, native resolution, etc. Windows usually finds the update info already (Monitor manufacturers have been real good about supplying this info to MS) but sometimes you might have an instance where Windows does not recognize the make and model. YOu can easily tell by going to your Device Manager and looking at. "Monitors" Do you see your Monitor Model or do you see Generic? Now Generic is just fine unless you are having issues with color, resolution, or certain features. Then you can just go to the manufacturers the Generic is just fine. I've had issues, in the past, with multiple monitors and the generic drivers. Installing the correct driver under those circumstances made all the difference. Unless there was a special need (such as screen splitting or the like mentioned already) or some specific issue, I haven't installed a monitor driver in who knows how long. If you're using DVI or HDMI there usually isn't a need as Windows can read the capability of the monitor since the communication is bi-directional. Using good old fashioned VGA you might have a need. I have never done it. Everything works as plug n play. No need to waste time. You are running: Windows 7 Drivers found in our drivers database.
